<b>SELECTED PROJECTS</b>	<b>Prism: Content-Aware Routing over TCP</b>	NSDI'21
	Prism enables content-aware routing of arbitrary-sized, encrypted application data over TCP, unlike the existing systems that rely on a custom UDP-based protocol. Prism modernizes the TCP handoff in the aid of programmable switches for robust operation and conformance to relevant features in recent Linux kernels.	
	<b>PASTE: A Network Stack for Non-Volatile Main Memory</b>	HotNets'21, NSDI'18, HotNets'16, ATC'16
	PASTE is a network stack that offers unified abstractions of network and non-volatile main memory. It fills the gap between the storage and network stacks designed in isolation, and solves the problem with the costs of moving and transforming data between these stacks that are significant for non-volatile main memory that offers fast, byte-addressable persistence.	
	<b>mSwitch: A Highly-Scalable, Modular Software Switch</b>	SOSR'15, CCR'14, NSDI'14, SoCC'17
	mSwitch solves the scalability problem of existing software switches that is crucial to consolidate a large number of VMs or virtualized network functions by a novel packet forwarding algorithm and streamlined data path. It was initially designed for ClickOS, a tiny unikernel that runs Click, and MultiStack, a framework that runs multiple user-space network stacks.	
	<b>Middlebox Measurement for TCP Extensibility</b>	IMC'11, NSDI'12
	This work was motivated by exploring viable design of Multipath TCP. It transmits various non-existent TCP traffic that mimics possible future TCP extensions to our server and examines on-path actions to the packets. This is the first work that examines in-depth middlebox behaviour prevalent in the Internet.
